Symbiosis and Autonomy

The concept of split personality and its consequences for psychotherapy

Psychosomatic Network

cell-to-cell-communication made by genes

immune system

hormone system

psychic system

multidimensional selective adaptive creative
Main functions of the “Psyche”

- Helping the living organism get access to reality
- outside the body
- within the body
- in order to survive and procreate
- The “psyche“ is a part of the psychosomatic network of the human body.
Main abilities of the Psyche

- to perceive
- to feel
- to think
- to remember
- to be conscious of oneself

“Psyche“ means different software programs to process information and to coordinate actions within the human body. “Soul“ is what human beings feel as their core and essential self.

© Prof. Franz Ruppert
Three main states of the Psyche

- Well being
  - no existential threat
    - openness to reality
    - existential threats
    - focusing on the dangerous reality
    - threats are overwhelming
    - denial of reality

- Stress programs

- Trauma reactions
Four human brains and their psychological programs

- left hemisphere: Speak! Think rationally! Be yourself!
- right hemisphere: Imagine and associate! Invent and create your own world!
- the mammal brain: Love your relatives! Keep close contact with your social groupings!
- the reptile brain: Fight or flight! Anxiety and aggression
Human development takes places between the polarities of symbiotic needs and the desire for autonomy.
Symbiotic necessities

- being nurtured
- being kept warm
- contact with bodies
- contact with eyes
- being understood
- being supported
- belonging exclusively to another person
Desire for Autonomy

- to gain confidence in one’s own perceptions and feelings
- to develop independent thoughts and opinions
- to rely on one own’s abilities to act
- to become self-responsible
- to become self-sufficient
For children “safe bonding” (J. Bowlby) to their parents is fundamental for self-confidence, confidence in human relations and mental health.

All their capacities can develop in a healthy way.
Symbiotically every child is doubly bonded to their mother:

passively: the emotional qualities of the mother are an imprint in the child’s soul

actively: the child clings to their mother and tries to support their mother

The symbiotic love of a child towards her mother is one of the most powerful emotional forces.
The most powerful emotional experience of every human being is the symbiotic relationship with the mother.
Files of Bonding

- smell
- eye contact
- touch
- movement
- skin temperature
- taste
- milk
For a child the relationship to his mother can become a symbiotic trauma.

The child is helpless and incapable of establishing a safe, holding relationship with a mother who is traumatised.
Trauma and parental love

• Traumatic experiences destroy the capacity of parents to love and care and be emotionally supportive.

• Because of their survival mechanism, traumatised parents avoid deep emotional contact with the child.
Traumatised mothers

- are emotionally unavailable
- carry a high emotional stress within them
- are emotionally needy
- can’t respect boundaries
- act unpredictably
- act aggressively
- carry splits in their souls.
A life experience becomes not only stressful but traumatic

- ... if we, or others, face a mortal risk and are incapable of dealing with it with the help of our stress programs and end up in a state of helplessness and agony.

© Prof. Franz Ruppert
When traumatised we are torn by the contradictions of our stress reactions and so we freeze, dissociate, and in the end split the whole personality in order to survive.
Splits in the personality and identity structure after a traumatic experience

- Traumatised part
- Survival part
- Healthy part
Characteristics of the healthy parts of an adult personality

- clear realism
- capable of regulating all feelings
- contact with oneself
- ability to make safe bonds and to dissolve bonds if necessary
- ability of true self-reflection

- self-responsibility
- love of truth
- optimism and basic confidence
- true autonomy
- strong enough to confront even traumatic experiences
Characteristics of the survival-parts

- constructing and guarding the splits in the psyche
- denying the trauma experience
- suppressing the traumatised parts
- avoiding memories
- controlling oneself and others
- looking for compensations
- creating illusions
- producing new splits
Characteristics of the traumatised parts

- store the memory of the trauma
- are always the same age as they were when the trauma occurred
- are still engaged with the traumatic experience
- can unpredictably and suddenly be triggered
- want to be released
Healthy structures within a child

- Own lifeforce and energy
- Own strong will to live
- Healthy basic needs
- Joy of movement and exercising the body
- Joy of playing
- Joy of learning and solving problems
Characteristics of the traumatised part in a symbiotic trauma

- despair that there is no love from mother
- deep loneliness
- fear of dying
- suppressed anger
- suppressed sadness
Characteristics of the survival parts in a symbiotic trauma

- Constant fighting and arguing to get into contact with the parents
- Idealising the mother or the father
- Identifying with the survival mechanisms of the mother/father
- Feeling responsible for the parents
- Identifying and resonating with the traumatised parts of the mother/father
- Repressing and denying one’s own trauma
Consequences of a symbiotic trauma for a child

- No ability to distinguish between own feelings and those of the mother
- not living one’s own identity
- lifelong symbiotic entanglement in relationships
- mental illnesses like hyperactivity, depression, psychotic states.
Characteristics of a symbiotic entanglement

• always looking to others
• distraction from one’s own problems
• clinging and merging
• weight of expectations on others
• anger, hate and violence in relationships
• illusions of love
Healthy or entangled relation?

Constructive and destructive types of relationships

- Equality
- Giving and taking is in balance
- Empathy and love are predominant feelings
- Parting is possible
- Partners can stay in their healthy parts

- Dominance and submission
- Exploitation
- Anxiety and aggression are predominant feelings
- Parting is forbidden
- To stay in the relationship is only possible if one splits
Four steps to heal traumata

- breaking through the gates of fear and pain
- using the gates to freedom
- passing the gates of illusions
- developing the healthy parts
“Constellation of my Intention*”

- show the amount of symbiotic entanglement and survival strategies caused by trauma
- minimise the risk of retraumatisation
- strengthen the development of the healthy structures of the psyche
- support the integration of the traumatised parts of the soul

* intent, purpose, goal of a constellation
